

**SYSTEM, METHOD, AND COMPUTER PROGRAM PRODUCT FOR
REFORMATTING NON-XML DATA FOR USE WITH INTERNET BASED SYSTEMS**

ABSTRACT OF THE DISCLOSURE

A client submits a service request, e.g., a SOAP request, an HTTP GET request or an
5 HTTP POST request. If necessary, parameters within a Structured Query Language (SQL)
string are replaced with corresponding values from the client service request. The SQL
statement is executed at a database which, in turn, generates a response to the SQL statement.
If necessary, the response is converted to XML. The response is then sent to the client.
